1- CHARACTERISTICS

Sands used by SNL are natural, siliceous for all the fractions, from the finest to the coarsest (4 mm). They are clean, their grains are generally of rounded shape. They are dried, screened and prepared in a factory by using robots.

So as to meet specific customer requests, our factory can perform sand recomposition which will match grading requirements determined by the client.

The sand packaging can be done in small flask, calibrated in mass (other packaging on demand).

2- CONTROLS

Series of grading measurements is made on each sand on the all. Those measurements are statistically analysed and allow to issue the certificate of analysis (mean, repeatability standard deviation).
